# System Demonstration

The  $\Omega$ MEGA Group  
Presentation: Andreas Meier<sup>1</sup> & Volker Sorge<sup>2</sup>

<sup>1</sup> University of Saarbrücken, Germany

<sup>2</sup> University of Birmingham, UK

©Meier & Sorge, 2002, Pisa – p.1

---

## I. INTRODUCTION

- Aims and Philosophy
- Background
- System

©Meier & Sorge, 2002, Pisa – p.3

---

## Overview

- I. Introduction
- II. Interactive theorem proving with  $\Omega$ MEGA
- III. Proof Planning in  $\Omega$ MEGA
- IV. Exploration

©Meier & Sorge, 2002, Pisa – p.2

---

## Aims

**Goal:** Mathematical Assistant System for proof development

- human-oriented
- abstract (top-down)
- knowledge-based
- mixed-initiative

**Current status:** implementation as a joint research platform for a collection of related and integrated research projects

©Meier & Sorge, 2002, Pisa – p.4

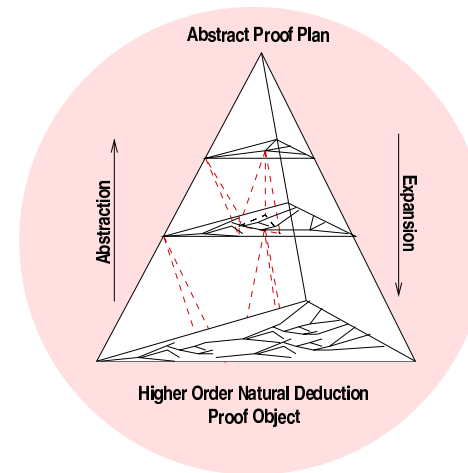

# Philosophy

- 'Top-down' approach to theorem proving
  - Proof construction with abstract steps
  - Expansion onto a basic logic level
  - Proof checking in a small ND calculus
- ⇒ Proving and expansion are equivalent problems
- Do not re-invent the wheel!  
(i.e., use existing technology)

© Meier & Sorge, 2002, Pisa – p.5

# Proof Object

## Proof Data Structure of $\Omega$ MEGA

maintains simultaneously  
a proof at  
different levels of abstraction

Higher-order language  
based on a  
simply-typed  $\lambda$ -calculus

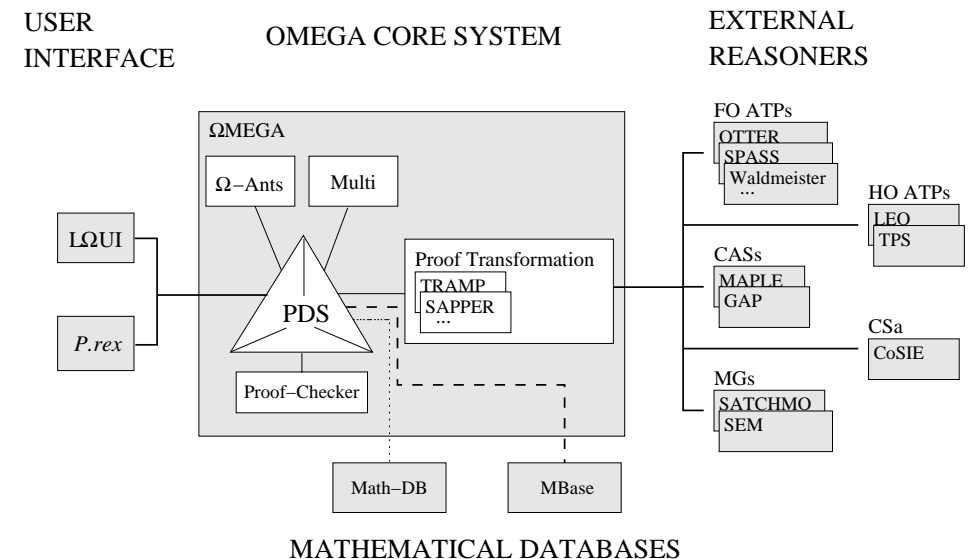

© Meier & Sorge, 2002, Pisa – p.6

# Proof Construction

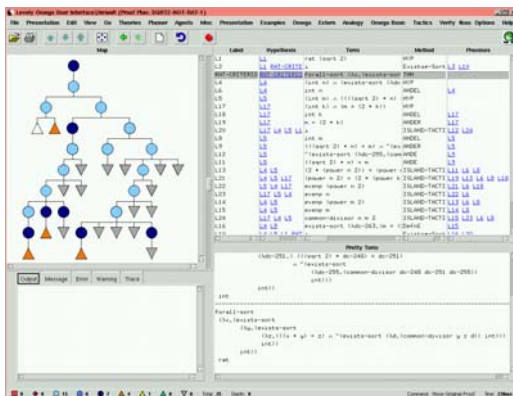

- Interactive proof construction with
  - 'failing' tactics (correctness not guaranteed, unlike LCF)
  - embedded external reasoners (ATP, CAS, ...)
  - facts from knowledge base
- Usable for both proving and expanding
- Automation via proof planning and agent mechanism

© Meier & Sorge, 2002, Pisa – p.7

# Architecture

© Meier & Sorge, 2002, Pisa – p.8

multi modal:  
proof tree  
linearized proof  
term browser

©Meier & Sorge, 2002, Pisa – p.9

## II. Interactive Theorem Proving

- Applying rules and tactics
- Using suggestion mechanism  $\Omega$ -ANTS
- Proof construction with islands
- Proof expansion and proof explanation

©Meier & Sorge, 2002, Pisa – p.10

## The $\sqrt{2}$ -Problem

*Theorem:*  $\sqrt{2}$  is irrational.

*Proof:* (by contradiction)

Assume  $\sqrt{2}$  is rational, that is, there exist natural numbers  $m, n$  with no common divisor such that  $\sqrt{2} = m/n$ . Then  $n\sqrt{2} = m$ , and thus  $2n^2 = m^2$ . Hence  $m^2$  is even and, since odd numbers square to odds,  $m$  is even; say  $m = 2k$ . Then  $2n^2 = (2k)^2 = 4k^2$ , that is,  $n^2 = 2k^2$ . Thus,  $n^2$  is even too, and so is  $n$ . That means that both  $n$  and  $m$  are even, contradicting the fact that they do not have a common divisor.

©Meier & Sorge, 2002, Pisa – p.11

## Formalization

The Problem:

```
(th~defproblem sqrt2-not-rat
  (in real)
  (conclusion (not (rat (sqrt 2))))
  (help "sqrt 2 is not a rational number."))
```

©Meier & Sorge, 2002, Pisa – p.12

# Formalization

---

## SQRT:

```
(th~defdef sqrt
  (in real)
  (definition
    (lam (x num)
      (that (lam (y num) (= (power y 2) x))))))
(help "Definition of square root."))
```

©Meier & Sorge, 2002, Pisa – p.13

# Interactive Proof Construction

---

Successive proof construction by

- applying rules
- applying tactics
- using external systems
- using facts from the database

Problems:

- Which facts are needed from database?
- Which rules/tactics/external systems are applicable?  
How are they applicable?

©Meier & Sorge, 2002, Pisa – p.15

# Formalization

---

## Rat-Criterion:

```
(th~deftheorem rat-criterion
  (in rational)
  (conclusion
    (forall-sort (lam (x num)
      (exists-sort (lam (y num)
        (exists-sort (lam (z num)
          (and (times x y) z)
              (not (exists-sort (lam (d num)
                (common-divisor y z d))
                int))))
            int)) int)) rat))
(help "x rational implies there exist integers y,z
      which have no common divisor with x=y*z."))
```

©Meier & Sorge, 2002, Pisa – p.14

# Suggestion Mechanism $\Omega$ -ANTS

---

## Goal:

- Compute possible next proof step
- Consider rules, tactics, external systems, theorems etc.
- Suggest commands + parameters to the user

## Realization:

- Realized in concurrent processes
- Computations in the background
- Exhibits anytime behavior

©Meier & Sorge, 2002, Pisa – p.16

# Proof Construction with Islands

**Problem:** How do we get the desired proof, if the tactics do not correspond to the necessary steps?

Insert steps as proof 'islands'

$$\frac{2 * n^2 = m^2}{\frac{Even(m^2)}{Even(m)}} \text{ Island}$$

⋮

Valid proof is generated by expansion.

©Meier & Sorge, 2002, Pisa – p.17

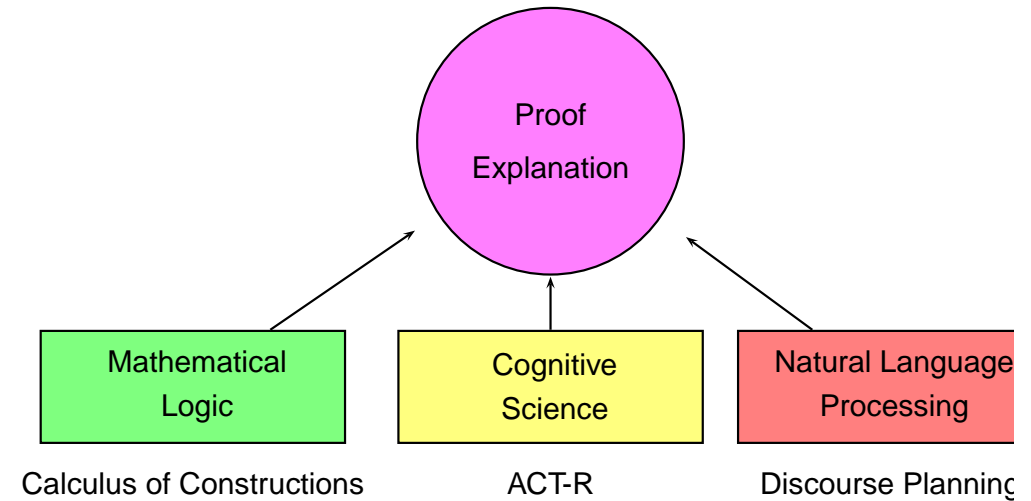

# Expansion of Proofs

Recursive and interleaved process:

- Normal 'failing' tactics
  - expansion (hopefully) **automatic**
- Island Tactic
  - **manually** construct expansion
  - close gap with **external reasoners**
- External reasoners
  - compute **automatically** expansions with special systems/interfaces (e.g. TRAMP, SAPPER, ...)

©Meier & Sorge, 2002, Pisa – p.19

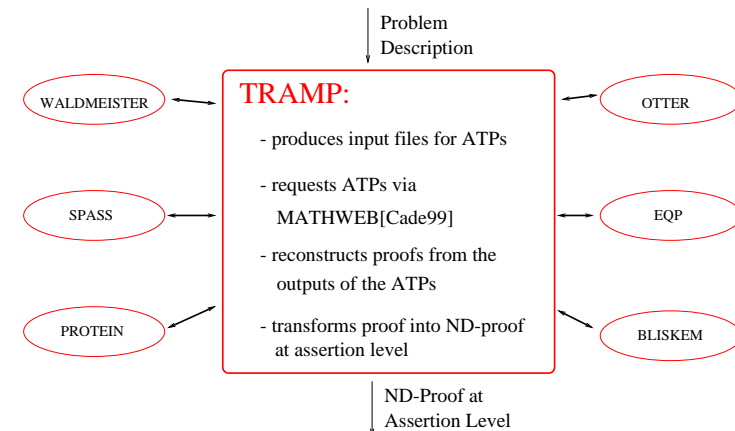

# P.rex: An Interactive Proof Explainer

©Meier & Sorge, 2002, Pisa – p.18

# The TRAMP System

Transformation of ATP output into ND-proofs at assertion level

©Meier & Sorge, 2002, Pisa – p.20

## III. Proof Planning

- Automated theorem proving at abstract level
- AI planning paradigm
- Knowledge Acquisition

©Meier & Sorge, 2002, Pisa – p.21

## Theorem Proving as Planning

**Initial State:** proof assumptions

**Goal:** theorem

**Operators:** called methods

- Methods representing (abstract) proving steps
- Method = tactic + specification

**Proof Plan:** sequence of actions, i.e., instantiated methods

**Planning Process:** precondition achievement planning

©Meier & Sorge, 2002, Pisa – p.23

## AI Planning

### ■ Initial State

$on(A, B), on(B, C), on\_table(C), on\_table(D), free(A),$   
...

### ■ Goal: $on\_table(B)$

### ■ Operators

PUTDOWN( $X$ ) prec: $holding(X)$ effect: $\oplus$ $on\_table(X),$ $hand\_empty$ $\ominus$ $holding(X)$
------------------------------------------------------------------------------------------------------------------------

### ■ Plan $pick(A), putdown(A), pick(B), putdown(B)$

©Meier & Sorge, 2002, Pisa – p.22

## Proof Planning in $\Omega$ MEGA

Knowledge-based proof planning

- domain-specific methods
- use of domain-specific external systems
- control-rules prune search space in particular domains

with multiple strategies

- strategies define different plan refinements (e.g. supply planner with different sets of methods and control rules)
- flexible combination and interleaving of strategies

©Meier & Sorge, 2002, Pisa – p.24

# Proof Planning the $\sqrt{2}$ -Problem

Knowledge acquisition, e.g.

## PrimeFacs-Product-m-f

**prec.**  $L: n * t = t'$   
**appl.-cond.**  $n = p_1 * \dots * p_n$  (CAS)  
**effect:**  $\oplus L_1: \text{prime-divisor}(p_1, t')$  (Expand-PrimeFacs(L))  
 $\vdots$   
 $\oplus L_n: \text{prime-divisor}(p_n, t')$  (Expand-PrimeFacs(L))

Methods include specification of expansion scheme

©Meier & Sorge, 2002, Pisa – p.25

## IV. Exploration

- Motivation
- Exploration with Oants
- Exploration with Multi

©Meier & Sorge, 2002, Pisa – p.27

## Case Studies

- Limit Theorems  
(employs COSIE, MAPLE)
- Residue Class Domain  
(employs MAPLE, GAP, WALDMEISTER, SEM, HR)
- Homomorphism Theorems

Only with older version of  $\Omega$ MEGA:

- Diagonalization proofs
- Completeness of resolution calculi

©Meier & Sorge, 2002, Pisa – p.26

## Motivation

Do **not only re-prove** known theorems, but

- Experiment with new conjectures
- Explore properties of structures

$\Rightarrow$  **Postulate**, **prove**, and **refute** conjectures

©Meier & Sorge, 2002, Pisa – p.28

# Set Problems

Examine different arbitrary set equations:

$$A \cup (B \cap C) = (A \cup B) \cap C$$

$$A \cup (B \cap C) = (A \cup B) \cap (A \cup C)$$

Show validity or invalidity

©Meier & Sorge, 2002, Pisa – p.29

# The Residue Class Domain

What kind of algebraic structures are ...

$$(\mathbb{Z}_4, \bar{+}), \quad (\mathbb{Z}_5, (x \bar{*} y) \bar{+} \bar{1}_5), \quad (\{\bar{0}_6, \bar{2}_6, \bar{4}_6\}, (x \bar{+} x) \bar{+} (y \bar{+} y))$$

...?

Successively check properties such as associativity, unit element, etc.

Which structures are isomorphic ?

$$(\mathbb{Z}_3, \bar{+}) \cong (\{\bar{0}_6, \bar{2}_6, \bar{4}_6\}, \bar{+}) \quad (\mathbb{Z}_2 \otimes \mathbb{Z}_2, \bar{+} \otimes \bar{+}) \not\cong (\mathbb{Z}_4, \bar{+})$$

©Meier & Sorge, 2002, Pisa – p.31

# Exploring with $\Omega$ -ANTS

- Consider some tactics and external reasoners
- Automated application of suggestions
- Involve complementary reasoning specialists
  - prove with automated theorem prover
  - refute with model generator
- Set examples: Proofs are simplified with some tactics and concluded by external reasoners

©Meier & Sorge, 2002, Pisa – p.30

# Exploration with Proof Planning

Examine properties step-by-step

- Exploration module employs Multi
  - Several strategies in Multi
  - Supported by CAS, Model Generator
- Proof plan a conjecture or its negation
- Guidance by example computation

©Meier & Sorge, 2002, Pisa – p.32
