

Ω mega

Christoph Benz Müller

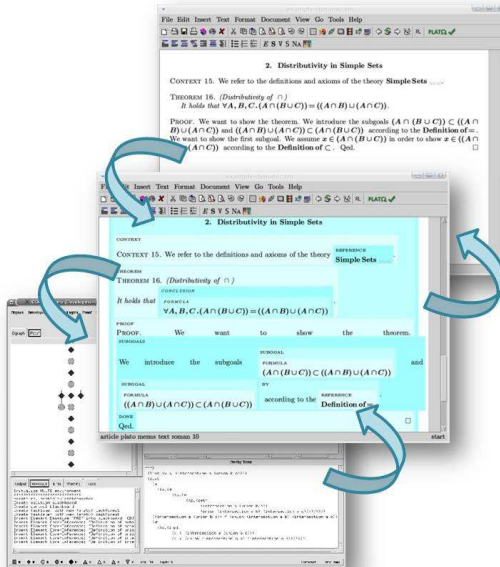

Sydney, Australia, 10 August 2008

IJCAR '08 Workshop on
Practical Aspects of Automated Reasoning
(PAAR-2008)

- ▶ Support user in **authoring documents**
- ▶ Definition of concepts and **notations**
- ▶ **Verification** of partial proofs
- ▶ **Completion** (filling gaps in the document)
- ▶ Detection of **missing subgoals**

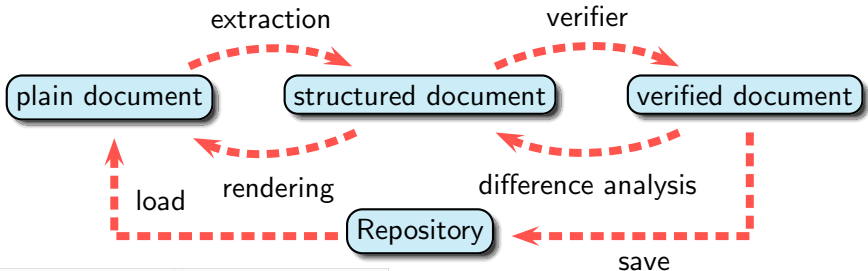

Three Processing Phases

The Global Picture

- **Document** is processed in three stages:

assume $x \in A \cap (B \cup C)$ **from** . ;
fact $x \in A \wedge x \in (B \cup C)$ **by** . **from** . ; ϵ

Incremental Proof Step Verification

Goal: Verifiable document

- ▶ Resolve underspecification
- ▶ Resolve ambiguities
- ▶ Completion

Proof Checking

- ▶ Proof checking under **complete information** is **simple** and **fast**
- ▶ If information is missing **proof search** is necessary

proof $\forall A, B, C. A \cap (B \cup C) = (A \cap B) \cup (A \cap C)$

assume $x \in A \cap (B \cup C)$
from ;
fact $x \in A \wedge x \in (B \cup C)$ **by**
from . ; ϵ

Incremental Proof Step Verification

Goal: Verifiable document

- ▶ Resolve underspecification

- ▶ If information is missing **proof search** is necessary

proof $\forall A, B, C. A \cap (B \cup C) = (A \cap B) \cup (A \cap C)$

subgoals

$A \cap (B \cup C) \subset (A \cap B) \cup (A \cap C)$
: {

assume $x \in A \cap (B \cup C)$

from **Subset** ;

fact $x \in A \wedge x \in (B \cup C)$ **by** **Set Intersection from . ;** {

$(A \cap B) \cup (A \cap C) \subset A \cap (B \cup C)$
: { ϵ }

by Set Equality from .

Further Information on Ω mega

- ▶ Logic: Church's simple type theory
- ▶ Polymorphism: limited (Prefix-Polymorphism)
- ▶ Semantics: Henkin semantics
- ▶ Calculus: directly mechanizes assertion level reasoning
- ▶ Automation: new proof planner under development
- ▶ Declarative language for specifying strategies and heuristics
- ▶ Relatively small problem library, growing
- ▶ Supports THF input (THF output forthcoming) via OmDoc
